1.
a. [2 points] Define the term equivocation.
b. [2 points] What is the absolute rate $R$ of a language with $L$ characters
c. [2 points] What is the principle of symmetry of position used for
d. [2 points] Define what it means for a cryptosystem to provide perfect secrecy. (Give the definition only.)
e. [2 points] Name at least one cryptosystem that provides perfect secrecy (assuming each key is used with equal likelihood).
2. [8 points] Is the following ciphertext monoalphabetically encrypted? Justify your answer.

DUPOZ PQPTQ OUFSS TJUJB ZBJTL
3. For each method of encryption, decrypt the given ciphertext using the given key:
a. [4 points] Coherent Running Key Cipher, Ciphertext = VIZDZGZ, Key = the text of this question (i.e. "for each method of encryption,.....")..
b. [2 points] One time pad, Ciphertext = 110101, Key = 110001.
4. [10 points] Suppose that I guessed that the keyword used for encrypting a Vigenère ciphertext has length 10. The following table gives the value of $\phi$ for each the 10 subtexts:

| Subtext | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Subtext length | 62 | 62 | 62 | 62 | 62 | 62 | 61 | 61 | 61 | 61 |
| $\phi$ | 314 | 340 | 214 | 224 | 280 | 210 | 270 | 256 | 291 | 214 |

Decide whether my guess is correct. Show your computations and explain your reasoning.

ID number:
5. (a) [2 points] Given a set of $n$ outcomes $X=\left\{X_{1}, X_{2}, \ldots, X_{n}\right\}$ where $X_{i}$ has probability $P\left(X_{i}\right)$ for $1 \leq i \leq n$, define the entropy $H(X)$ of $X$.
(b) [4 points] Suppose we have the following set of messages and their associated probabilities of being sent:

| Message | Sell <br> all stocks | Buy <br> Mutual funds | Buy <br> gold | Buy internet <br> stocks | Buy IBM <br> stocks | Sell tech <br> funds |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Probability | $1 / 16$ | $1 / 4$ | $1 / 8$ | $1 / 16$ | $1 / 4$ | $1 / 4$ |

Compute the entropy of this set of messages.
(c) Let $n=2$ and suppose that $p\left(X_{1}\right)=p$ and $p\left(X_{2}\right)=1-p$.
i. [1 point] Write down $H(X)$ as a function of $p$.
ii.[1 point] What is the value of $H(X)$ for $p=1 / 2$ (i.e. when $X_{1}$ and $X_{2}$ occur with equal probabilities)?
iii. [8 points] Prove that $H(X)$ is maximal if and only if $p=1 / 2$.

ID number:
(part (c) continued)
