

# MATH 205 L01 Winter 2002

## Midterm 50 Minutes

NAME: KEY ID: \_\_\_\_\_

No Calculators

1. For each question answer T or F only. [20]
- (a) The work of René Descartes had great influence towards unifying the mathematics of his time. T
  - (b) Grecian mathematics was far more on the theoretical side than the applied side. T
  - (c) Calculus was one of the great discoveries of Grecian mathematics. F
  - (d) Probability theory originated with the work of Hindu and Arabic mathematicians in the period 400-900 AD. F
  - (e) Algebra originated with the work of Hindu and Arabic mathematicians in the period 400-900 AD. T
  - (f) Chinese mathematicians around 400 AD already knew the value of  $\pi$  to about 6 digits. T
  - (g) Greek mathematicians not only knew the Earth was round but also calculated its size. T
  - (h) Leonhard Euler was the most famous Italian mathematician during the 1700's. F
  - (i) Sophie Germain, in the period 1810-1830, was the first notable female mathematician. F
  - (j) Prime numbers of the form  $2^n - 1$  (where  $n$  is itself a prime), are named after the Frenchman Pierre de Fermat. F

2. To 3 decimal place accuracy it is true that  $\sqrt{2} = 1.414$ . Explain, in one to two sentences, whether the statement  $\sqrt{2} = 1.41414141\dots$  is true or false. [20]

False

because  $\sqrt{2} \notin \mathbb{Q}$ , whereas  $1.\overline{41} \in \mathbb{Q}$

3. (a) In base 3, find  $1202 + 2211$ . [20]

$$\begin{array}{r} 1202 \\ 2211 \\ \hline 11120 \end{array}$$

$$= \boxed{11120}$$

(6)

- (b) In base 2, find  $1011 \times 1101$ .

$$\begin{array}{r} 1011 \\ 1101 \\ \hline 1011 \\ 10110 \\ 1011 \\ \hline 10001111 \end{array}$$

$$\boxed{10001111}$$

(6)

- (c) Write the base 10 number 5,376 as a Mayan number.

$$\begin{array}{r} 20 \overline{) 5376} \\ \underline{20 \ 268} \quad 16 \\ 13 \quad 8 \end{array}$$

⋮  
⋮  
⋮

(8)

4. (a) In  $\mathbb{Z}_{23}$ , find  $16(3^2 + 4^2)$ .

[20]

$$= 16 \times 2 = \boxed{9} \quad \textcircled{6}$$

(b) In  $\mathbb{Z}_{23}$ , find  $7^{-1}$ .

$$\begin{array}{ccccccc} 1 & 24 & 47 & 70 & \dots & & \\ & & & \text{"} & & & \\ & & & 7 \times 10 & & & \textcircled{7} \end{array}$$
$$7^{-1} = \boxed{10}$$

(c) If  $28^{2244}$  is divided by 23, what is the remainder?

$$\begin{aligned} 28^{2244} &= 5^{2244} && \text{in } \mathbb{Z}_{23} \\ &= 5^0 && \text{by Fermat's Little Theorem, since } 5^{22} = 1 \\ &= \boxed{1} && \text{and } 22 \mid 2244 \end{aligned}$$

$\textcircled{7}$

5. (a) Find the greatest common divisor  $\gcd(182, 403)$ .

[20]

$$\begin{array}{r} 2 \\ 182 \overline{) 403} \\ \underline{364} \phantom{0} \\ 39 \end{array} \quad = \boxed{13}$$
$$\begin{array}{r} 4 \\ 39 \overline{) 182} \\ \underline{156} \\ 26 \end{array}$$
$$\begin{array}{r} 1 \\ 26 \overline{) 39} \\ \underline{26} \\ 13 \end{array}$$
$$\begin{array}{r} 2 \\ \boxed{13} \overline{) 26} \\ \underline{26} \\ 0 \end{array}$$

(15)

(b) Using (a) explain why the Diophantine equation

$$182x + 403y = 26,005$$

can have no solution (in integers).

Reason  $13 \nmid 26,005$

(clearly  $13 \mid 26,000$ , hence  $26,005 \equiv 5 \pmod{13}$ )

(5)
